

- I'm a Software Full stack developer with 2 + years of experience working independently on multiple technologies. Technologies that I have used Java, PHP, Python, Redis, MySQL, CockroachDB, Angular and for messaging queue using RabbitMQ. I have experience with Vue.js also
- My Work is refactoring the code for scaling up the application and implementing new features and functionalities according to the Govt guidelines and improving the products for an existing products.
- Initially, I have done one website with responsive for mobile/lappy/tablet using WordPress for the organization, and it is accessible to everyone to check what we do internally and our products in a company.
- I have very good experience in python implementing auto jobs which are event and schedule-based jobs and this workers is developed with integrating the RabbitMQ. Auto jobs is to reduce the manual power and generate reports on a daily basis and having experience with micro-services
- I have handled a few modules which are designed and developed by myself and I have added the event alerts for an issue or any lag or load on the DB that Continuously monitor the system stability of the modules and if any issue arises digging into that and checking the ELK logs and resolving the production issues.
- Here I need to do work, after the requirement I only need to design, develop, and produce on prod, just like taking my own responsibility for my modules and collaborating with team members and QA to provide the KT and guiding Juniors to understand the work and workflow.
- I'm the primary developer for debugging the production level issue.
